Go to Settings > Storage. Toggle on Smart Storage to automatically delete old photos and videos when the phone is low on space. Tap an app and clear its cache or data (files, settings, and accounts) to address problems with an app that acts up. Tap Free Up Space to display files organized by category. Select any items you want to remove and tap Free up X GB. This article explains how to clear up phone storage on your Android device using the built-in storage manager in Settings. This information applies to Android devices made by Samsung, Google, Huawei, Xiaomi, and more. When you free up space on your Android device, the phone has more space for new apps, photos, videos, and music, and often, faster performance. When a phone is close to full, it tends to get sluggish. Android refers to this feature as storage, but file management is what it does. To access your files, go to Settings. The Storage section displays how much room is available: X% used - X GB free. Tap Storage. You'll see a list of everything on your phone, in categories including music & audio, games, files, and system (files need to run your OS). You can toggle on Smart Storage at the top, which automatically deletes old photos and videos when the phone is close to running out of space. Tap a category to view the apps associated with it. Tap an app, and clear the cache or clear data (files, settings, and accounts). These actions can often fix problems with an app that's acting up. Go back to Storage settings. Tap Free Up Space to display files organized by category: Backed up photos & videos, Downloads, and Infrequently used apps, along with how many gigabytes each uses. The Backed up photos & videos option is all or nothing; you can't select specific files. Tap Downloads to see a list of PDFs and other documents. Under Infrequently used apps is a list of apps organized by how recently you've opened them. Select any items you'd like to remove and tap Free up X GB. You'll get a confirmation popup message that offers to turn on Smart Storage if it's not already enabled. To delete an unwanted app, go to the Google Play Store, tap My Apps, select the app, and tap Uninstall. Another method is to drag unwanted apps from the app drawer to the trash icon that appears when you press and hold an app. You can't delete many pre-loaded apps, otherwise known as bloatware, without rooting the device. Another way to make space on an Android smartphone is to back up your pictures to Google Photos, which offers unlimited cloud storage and access to your images on any device. For other files, offload them to Dropbox, Google Drive, or another cloud service. You can also move apps to an SD card to save space. If you want to access Android system files, you can root your smartphone and install a third-party file manager. Rooting your smartphone is a straightforward process, and the risks are relatively small. The benefits include the ability to manage files on the smartphone, remove bloatware, and more. If you want to do a quick cleanup, as you would on a computer, the built-in tool does the trick. Always be sure to back up your data first, in case you accidentally delete something important. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! It's not always easy to find reliable Wi-Fi on the go, especially if you're looking for a secure, private connection. Public Wi-Fi networks can leave you vulnerable to hackers and create privacy issues if you're viewing sensitive data. But if you have an Android smartphone in your pocket, you're just a few steps away from having a private, personal Wi-Fi hotspot. All smartphones running Android 2.2 or later have built-in hotspot capabilities, but some carriers might limit access to the feature depending on your wireless plan. Also, your smartphone might run a slightly different version of Android depending on your device - few devices carry stock Android, instead applying a proprietary interface, like Samsung TouchWiz. So some of these steps might look slightly different on your device. First check with your mobile carrier The first step is to check with your mobile carrier - some companies impose data limits, or will ask you to purchase an additional plan. Verizon includes mobile hotspot access for no additional charge on most plans, but some plans require an additional fee or charge you if you exceed your data limits. AT&T also includes hotspot access in most of its plans, with charges if you go over your monthly data limits. T-Mobile charges \$14.99 per month for mobile hotspot access, allowing you to connect up to five devices at a time. Sprint includes mobile hotspot access into some - but not all - of its plans; if you go over the allotted data amount, you won't be charged extra, but it switches from 4G LTE to 2G connectivity. Once you have confirmed that

you can use your iPhone as a mobile hotspot with a wireless plan, follow the steps below. Step 1 On your home screen, tap settings > wireless & networks. Step 2 Look for "Portable Wi-Fi Hotspot" and tap the check mark, or toggle the slide bar, next to the option. (On some devices, you may need to tap "more" to expand the list of options under the wireless & networks category.) Step 3 Tap on "Wi-Fi hotspot settings" or "Configure Wi-Fi hotspot." Depending on your device, your hotspot settings might be named something slightly different. Here, you can see the default password for your mobile hotspot. Note: Within these settings, you can also change the password, rename the network SSID, adjust security settings and manage other devices connected to your hotspot. Step 4 Open the Wi-Fi settings on the device you want to connect, and find your Android hotspot on the list of available networks. The name of your hotspot will be the same as the Network SSID under your hotspot settings. Step 5 Decide if you want to connect your device to your Android hotspot using Wi-Fi, Bluetooth or USB. Connecting via Wi-Fi Go to the Wi-Fi settings on the device you want to tether to your Android device. Look for your network, which will be the same as the Network SSID name under your hotspot settings. Tap the network name and connect using the password you created in step 3. Connecting via Bluetooth Turn on the Bluetooth setting on the device you want to connect. Go to the settings on your Android device and select "Bluetooth." Find the device you want to connect, and select it to pair. You might see a code appear on your tablet or notebook — you will need to enter that into your Android device to connect. Connecting via USB Using the USB cable that came with your Android device, plug it into your Mac or PC. Choose your network from the list of Wi-Fi networks on your computer. Disconnecting devices To see what devices are connected to your hotspot, you can head back into your hotspot settings to see a list of connected devices and disconnect devices one by one. Or, you can simply turn off your hotspot, and all devices will disconnect immediately. Tracking data If you're worried about going over your monthly data limit, you can check your monthly data usage on your Android smartphone under settings > data usage. Alternatively, you can always log into your Verizon, Sprint, T-Mobile or AT&T account to see how much data you have left. Alternative for Samsung users If you have multiple Samsung devices, you can share your hotspot capabilities instantly using Samsung Flow. Similar to Apple's "Instant Hotspot" feature, sharing your hotspot through Samsung Flow only works between Samsung devices. Always make sure you review your plan's data limits, so you know how much you will be charged if you go over. Once you activate your Wi-Fi Hotspot, you will see a message in your notification bar. Make sure to set a strong password to keep your hotspot secure, especially if you are using it in a public place. Using your phone as a hotspot will drain your battery faster, especially if you connect wirelessly, so you'll want to make sure you can charge your phone if necessary.
